|  | 2.0 | 44 | 300 | 1.3 | 300 | 200 | 180 | 150 | 150 | $5: 1$ | $44 \times \mathrm{b}_{\mathrm{D}}$ | $1.3 \times \mathrm{b}_{\mathrm{D}}$ |
|  | 3.0 | 60 | 200 | 1.3 | 200 | 150 | 130 | 100 | 100 | 3.3:1 | $60 \times \mathrm{b}_{\mathrm{D}}$ | $1.3 \times \mathrm{b}_{\mathrm{D}}$ |

$\sigma_{\mathrm{Vu}} \quad$ Determined at laekage class $\mathrm{L}_{1,0}$
$\mathrm{m} \quad$ The m -factor is a value to describe the minimum surface pressure under operating conditions. Up to now there does not exist a definite test specification. The $m$-factor can be looked at in different ways and depends on the tightness class, the temperature and the surface pressure in the installed state. Within the Brite EuRam research project $m$-factors between 1.3 and 3.8 were found as average values for graphite gaskets. The user may judge to calculate with different factors (e.g. $m=2$ ).

Please note: standard laboratory equipment. In view of the variety of different installation and operation conditions and process engineering options, there is no basis for warranty claims
Version: v7e referring to the behaviour of the sealing joint. Subject to technical changes and printing errors.
